## FUNCTION

The GIGASENSE anti-collision system controls and protects track bound cranes or similar machinery. Each crane has its own unit (A or B), which consist of an active antenna and a relay box.

The antenna sends a microwave signal to the opposite unit. By using Doppler technique, the distance and relative speed are calculated.

The output from the electronics activates the preset relays in the relay box.

There are 3 relays in the relay box: Relay 1 = Warning (speed reduction).

Relay 2 = Stops crane movement.

Relay 3 = Function control.

## SAFETY

- Helps protect people and property.
- The units have a built in self diagnostic function that monitors the performance of the unit every three seconds.

## ECONOMY

- Cuts crane repairs, downtime and costs.
- Easy and quick to install.
- Maintenance free.
